## **CLAIMS**:

The claims are reproduced below for convenience. The claims, as currently pending in the application, read as follows:

## 1. to 117. (Cancelled)

library for storing a plurality of filters and a processor for processing a computer program stored on a computer-readable storage medium, wherein said processor executes, by processing the computer program, the following steps:

a selecting step for selecting and loading a plurality of desired filters from said library based on a first user instruction in order to form an application, wherein the plurality of selected desired filters are arranged in a sequence based on the first user instruction, and wherein the plurality of selected desired filters are used for filtering a data object based on the sequence;

a modifying step for modifying a user interface description object, written in a markup language, to add codes of user interface components corresponding to the selected desired filters arranged in the sequence; and

a generating step for generating display data for displaying the user interface components corresponding to the plurality of selected desired filters in a display apparatus, by parsing the user interface description object modified in said modifying step, wherein a user inputs data to the plurality of selected desired filters via the user interface components, and wherein a user interface component corresponding to a filter further selected based on

a second user instruction from the plurality of desired filters selected in said selecting step may be selectively hidden.

- 119. (Previously Presented) The data processing apparatus according to claim 118, wherein, in said modifying step, said processor adds codes of the plurality of desired filters to the user interface components in the arranged sequence.
- 120. (Previously Presented) The data processing apparatus according to claim 119, wherein, in said modifying step, said processor changes the codes of a previously added filter when said processor adds the codes of the plurality of desired filters to the user interface components.
- 121. (Previously Presented) The data processing apparatus according to claim 118, wherein the user interface components corresponding to the plurality of desired filters are displayed based on the arranged sequence when the display data is outputted to the display apparatus.
  - 122. (Cancelled)
  - 123. (Cancelled).
  - 124. (Previously Presented) The data processing apparatus according to

claim 118, wherein the plurality of desired filters includes a toolbar filter for displaying a user interface component corresponding to another filter on a toolbar, and wherein, in said modifying step, said processor modifies the user interface description object for displaying the user interface component corresponding to the other filter on the toolbar.

- 125. (Previously Presented) The data processing apparatus according to claim 118, wherein the plurality of desired filters includes a filter for search data based on a search target inputted by a user.
- 126. (Previously Presented) The data processing apparatus according to claim 118, wherein the plurality of desired filters includes a display filter for displaying input data on the data display area.
- 127. (Previously Presented) The data processing apparatus according to claim 118, wherein the plurality of desired filters includes a printer filter for outputting appropriate data for a printer based on a functionality of the printer.
- 128. (Previously Presented) The data processing apparatus according to claim 118, wherein the plurality of desired filters includes a help filter for providing help information.
- 129. (Previously Presented) The data processing apparatus according to claim 118, wherein the markup language is XML.

data processing apparatus having a library for storing a plurality of filters, the method comprising:

a selecting step for selecting and loading a plurality of desired filters from said library based on a first user instruction in order to form an application, wherein the plurality of selected desired filters are arranged in a sequence based on the first user instruction, and wherein the plurality of selected desired filters are used for filtering a data object based on the sequence;

a modifying step for modifying a user interface description object, written in a markup language, to add codes of user interface components corresponding to the selected desired filters arranged in the sequence; and

a generating step for generating display data for displaying the user interface components corresponding to the plurality of selected desired filters in a display apparatus, by parsing the user interface description object modified in said modifying step, wherein a user inputs data to the plurality of selected desired filters via the user interface components, and wherein a user interface component corresponding to a filter further selected based on a second user instruction from the plurality of desired filters selected in said selecting step may be selectively hidden.

131. (Previously Presented) The data processing method according to claim 130, wherein, in said modifying step, codes of the plurality of desired filters are added to the user interface components in the arranged sequence.

- 132. (Previously Presented) The data processing method according to claim 131, wherein, in said modifying step, the codes of a previously added filter are changed when the codes of the plurality of desired filters are added to the user interface components.
- 133. (Previously Presented) The data processing method according to claim 130, wherein the user interface components corresponding to the plurality of desired filters are displayed based on the arranged sequence when the display data is outputted to the display apparatus.
  - 134. (Cancelled).
  - 135. (Cancelled).
- 136. (Previously Presented) The data processing method according to claim 130, wherein the plurality of desired filters includes a toolbar filter for displaying a user interface component corresponding to another filter on a toolbar, and wherein, in said modifying step, the user interface description object is modified for displaying the user interface component corresponding to the other filter on the toolbar.
- 137. (Previously Presented) The data processing method according to claim 130, wherein the plurality of desired filters includes a filter for search data based on a search target inputted by a user.

- 138. (Previously Presented) The data processing method according to claim 130, wherein the plurality of desired filters includes a display filter for displaying input data on the data display area.
- 139. (Previously Presented) The data processing method according to claim 130, wherein the plurality of desired filters includes a printer filter for outputting appropriate data for a printer based on a functionality of the printer.
- 140. (Previously Presented) The data processing method according to claim 130, wherein the plurality of desired filters includes a help filter for providing help information.
- 141. (Previously Presented) The data processing method according to claim 130, wherein the markup language is XML.
- 142. (Previously Presented) A computer-readable storage medium storing processor-implementable instructions for controlling a processor to carry out:

a selecting step for selecting and loading a plurality of desired filters from a library based on a first user instruction in order to form an application, the library storing a plurality of filters, wherein the plurality of selected desired filters are arranged in a sequence based on the first user instruction, and wherein the plurality of selected desired filters are used for filtering a data object based on the sequence;

a modifying step for modifying a user interface description object, written in

a markup language, to add codes of user interface components corresponding to the selected desired filters arranged in the sequence; and

a generating step for generating display data for displaying the user interface components corresponding to the plurality of selected desired filters in a display apparatus, by parsing the user interface description object modified in said modifying step, wherein a user inputs data to the plurality of selected desired filters via the user interface components, and wherein a user interface component corresponding to a filter further selected based on a second user instruction from the plurality of desired filters selected in said selecting step may be selectively hidden.
